the speed control of dc motors is very crucial in applications where the importance of precision and protection purpose of a motor speed controller is to take a signal representing the required speed and to drive a motor at that speed micro controller can provide easy control of dc motor this project is about speed control system of dc motor by using micro controller and it is a closed loop control system pulse width modulation pwm technique is used where its signal is generated in microcontroller which is the signal will send to motor driver to vary the voltage supply to control motor speed

the automatic control has played a vital role in the advance of engineering and science nowadays in industries the control of direct current dc motor is a common practice thus the implementation of dc motor of controller speed is important the main purpose of motor speed control is to keep the rotation of the motor at the preset speed and to drive a system at the demanded speed when used in speed application speed feedback control the dc motor s speed or confirms that the motor is rotating at the desired speed to maintain the speed it requires the speed feedback at all times the speed of a dc motor usually is directly proportional to the supply voltage for instance if we reduce the supply voltage from 12 volts to 6 volts the motor will run at half or lower the speed the advantages used dc motor is provide excellent speed control for acceleration and deceleration with effective and simple torque control the fact that the power supply of a dc motor connects directly to the

field of the motor allows for precise voltage control which is necessary with speed and torque control applications the common methods are used to control speed dc motor is proportional integral derivative pid and pc based to control it in this project the method use as controller is programmable interface controller pic microcontroller for the electric current control to drive a motor the expectation of this project is to get the precise the demanded speed and to drive a motor at that speed

motor controller is an equipment that been use to determine the movement of an electric motor in a desired way the speed control of motor is very difficult to be implemented by using conventional control techniques as it quires a very complex mathematical model the purpose of this project is to describe the research of pid controller design based on programmable logic controller plc in order to control the speed of the motor the model of the plc that has been used in this project is omron cjig cpu42p where this plc has a build in loop control that can be made the ladder diagram quite simple using function block in cx process tools in this project the system without controller shows that is an open loop control hence when break is applied there is no feedback for the system to increase the voltage in order for the motor to maintain the desired speed output compare by using the pid controller when the breaking is applied there is a feedback for the system to increase the voltage to get the desired output analysis done and it shows that the proportional integral controller with fine tuning is much better performance compare to the proportional proportional integral derivative controller with and without fine tuning and without controller in the system

the book is intended for students and electrical technicians it is a resume of some vsd are largely used in the industries it can be used for students academics and practitioners to check the wiring installation and to enter the basic parameters of vsd

the purpose of this study is in electronic scope to design a dc speed controller circuit controlled by computer as a gui graphical user interface from minimum to maximum speed this project is focus on the dc motor speed control by varying the duty cycle of pulse with modulation pwm signal via computer pc nowadays the computers are widely used in daily applications as a graphical user interface gui because it is easy to

monitoring save cost and time in this project pc used to generate pwm signals assisted by microsoft visual basics software thus reduced hardware implementation in a system pwm speed control is desirable due to its high power efficiency compare with another method of speed control like frequency control current and voltage control the motor averages the input duty cycle into a constant speed which is directly proportional to the percent duty cycle the software send pwm signal to the driver circuit through the rs232 serial port the driver circuit will boosted the pwm signal to drive the mosfet and thus control the motor the speed of dc motor is depending on the spectrum of pwm that refer to their duty cycle this project was able to control the motor speed via pc from zero to maximum speed which is most important feature in industrials control applications

academic paper from the year 2020 in the subject computer science miscellaneous language english abstract in this paper we describe a technical system for dc motor speed control the speed of dc motor is controlled using neural network based model reference and predictive controllers with the use of matlab simulink the analysis of the dc motor is done with and without input side torque disturbance input and the simulation results obtained by comparing the desired and actual speed of the dc motor using random reference and sinusoidal speed inputs for the dc motor with model reference and predictive controllers the dc motor with model reference controller shows almost the actual speed is the same as the desired speed with a good performance than the dc motor with predictive controller for the system with and without input side disturbance finally the comparative simulation result prove the effectiveness of the dc motor with model reference controller

the proportional integral derivative pid controllers are widely used in many industrial control systems for several decades since ziegler and nichols proposed their first pid tuning method this is because the pid controller structure is simple and its principle is easier to understand than most other advanced controllers on the other hand the general performance of pid controller is satisfactory in many applications for these reasons the majority of the controllers used in industry are of pi pid type pid controllers are widely used for process control applications requiring very precise and accurate control the purpose of the motor speed controller is to take a signal representing the demanded speed and to drive a motor at that speed the controller does not actually measure the speed of the motor thus it is called an open loop speed controller motors come in a variety of forms and the speed controller s motor drive output will be different dependent on these forms the speed controller presented here is designed to drive special dc motor which is not easily available anywhere in store thus it is a good

example to be used due to the special characteristics and parameters matlab simulink is an important tool used in this project from designing the mathematical model of the dc motor obtaining the transfer function and designing the pid controller using both model and programming using m files the transfer function will be linearized and used for tuning the gain of pid controller like k_p k_i and k_d simulink is chosen to simulate the performance of the control system

nowadays dc motors play a vital role in most of the industrial areas it can be seen in most of the electronic devices the purpose of a motor speed controller is to take a signal representing the demanded speed and to drive a motor at that speed in this project the power converter for dc motor application is developed one of the most common methods is by using pwm wave to control the speed of the motor therefore to provide the required power to the motor a SPWM is used to supply the dc motor from ac power supply rectifier which converted ac to dc and buck converter are combined which output can be supplied to the dc motor the SPWM which supplies the dc motor is developed and the output is controlled by using pwm TL494 is used to generate the pwm wave which can be varied in duty ratio in the end of this project the motor speed will satisfy the desired speed control as expected

recent advances in LSI technology and the consequent availability of inexpensive but powerful microprocessors have already affected the process control industry in a significant manner microprocessors are being increasingly utilized for improving the performance of control systems and making them more sophisticated as well as reliable many concepts of adaptive and learning control theory which were considered impractical only 20 years ago are now being implemented with these developments there has been a steady growth in hardware and software tools to support the microprocessor in its complex tasks with the current trend of using several microprocessors for performing the complex tasks in a modern control system a great deal of emphasis is being given to the topic of the transfer and sharing of information between them thus the subject of local area networking in the industrial environment has become assumed great importance the object of this book is to present both hardware and software concepts that are important in the development of microprocessor based control systems an attempt has been made to obtain a balance between theory and practice with emphasis on practical applications it should be useful for both practicing engineers and students who are interested in learning the practical details of the implementation of microprocessor based control systems as some of the related material has been published in the earlier volumes of this series duplication has been avoided as far

as possible

a design for a motor speed controller of low cost and high precision is presented it makes possible the regulation of the rotation speed of a series wound electric motor to an accuracy of 1.5 rpm over the range 15 to 5000 rpm the design incorporates a digital display of the rotation speed and provides for the programming of the speed by an external voltage source
