from a multidisciplinary perspective that investigate the complex interactions of
tectonics and surface processes in the subduction related orogen of the andes
of central chile and argentina c 27 39 s it aims to improve our understanding of
tectonic and landscape evolution of the andean range at different time scales as

well as the mutual relationship between internal and external mechanisms in cenozoic deformation mountain building topographic evolution basin development and mega landslides occurrence across the flat slab to normal subduction segments the geodynamic processes of the andes of central chile and argentina are analysed from a number of subdisciplines of the earth sciences including tectonics petrology geophysics geochemistry structural geology geomorphology engineering geology stratigraphy and sedimentology

a comprehensive climbing guide to the mountains of the andes from venezuela to tierra del fuego it features route descriptions for over 300 peaks with over half illustrated by a photo diagram and full colour maps

the objective of this volume is to examine the cenozoic tectonic and magmatic evolution from the arc to the retroarc of a distinctive end member of the andean accretionary orogen between 35 s and 39 s the evolution of the andes in this region provides an outstanding case study of an orogen where periods of contraction and extension crustal shortening and normal faulting and differences in retroarc volcanism reflect a tectonic regime that alternates in space and time structural magmatic and paleogeographic patterns correlate strongly with the dynamics of the subduction zone the region includes the neuquen basin which is one of the most prolific of the central andes the tectonic setting is important in understanding hydrocarbon systems of the sub andean basin and the potential for ore deposits in the cordillera the book is fundamental for researchers working on tectonics and magmatism in andean type systems as well as those involved in exploration publisher s website

this atlas illustrates the significant reduction in glacier mass happening throughout the andean region it quantifies the contribution of glaciers to drinking water supplies in cities and to agriculture hydropower and industries a reduction in glacier mass results in a long term reduction in seasonal melt water which is the mainstay of livelihoods for millions of people

extending as they do over about 7 500 km the andes form the pacific boundary of south america and represent as it were the backbone of this southern continent they are part of the circumpacific mountain system some features of which differ from those of the w e trending orogenic zones of the earth there are more igneous rocks present than in many parts of the tethyan geosynclines the tectonic structure is characterized in particular by significant normal faulting while there are fewer overthrusts or deformations caused by folding especially

in the overlying rock the majority of the deep focus earthquakes and megaseisms and also most of the recent volcanic activity are connected with this region prominent deep sea trendies run parallel to the continents and to the island arcs which encircle the pacific the actual andean orogen is distinguished by further dominant geological aspects from the morphology one would think that the orogenic events were contemporaneous whereas in fact the mountain range has been formed since the precambrian by temporally and spatially superimposed crustal sections there is no such thing as a uniform andean geosyncline but instead there are several separate fully developed sections which were welded together during different geodynamic phases any attempt to give a concise general account of the problems encountered and the progress made in studying the geology of the andes is a questionable venture in the last twenty years so many data have been gathered in all the geoscientific disciplines in the andean region that it has become next to impossible for a single individual to follow every aspect of the subject let alone to write about them it was therefore necessary right from the start to limit the subject matter and to make a selection of the new knowledge to be dealt with for example merely to have attempted to describe all the new stratigraphie details would have gone far beyond the scope of this book here and in many other instances it is necessary to refer the reader to the literature on the subject in addition the state of researdi still varies considerably from section to section of the orogen the accuracy and the scale of the geological maps on which the geoscientific facts are mainly based flucuate within wide limits and in many countries the preparation of large scale maps has only recently got under way

the andean region is perhaps the most violent and politically unstable in the western hemisphere politics in the andes is the first comprehensive volume to assess the persistent political challenges facing bolivia colombia ecuador peru and venezuela arguing that andean states and societies have been shaped by common historical forces the contributors comparative approach reveals how different countries have responded variously to the challenges and opportunities presented by those forces individual chapters are structured around themes of ethnic regional and gender diversity violence and drug trafficking and political change and democracy politics in the andes offers a contemporary view of a region in crisis providing the necessary context to link the often sensational news from the area to broader historical political economic and social trends
