structured analytic techniques sats are intended to improve intelligence analysis by checking the two canonical sources of error systematic biases and random noise although both goals are achievable no one knows how close the current generation of sats comes to achieving either of them we identify two root problems 1 sats treat bipolar biases as unipolar as a result we lack metrics for gauging possible over shooting and have no way of knowing when sats that focus on suppressing one bias e g overconfidence are triggering the opposing bias e g under confidence 2 sats tacitly assume that problem decomposition e g breaking reasoning into rows and columns of matrices corresponding to hypotheses and evidence is a sound means of reducing noise in assessments but no one has ever actually tested whether decomposition is adding or subtracting noise from the analytic process and there are good reasons for suspecting that decomposition will on balance degrade the reliability of analytic judgment the central shortcoming is that sats have not been subject to sustained scientific of the sort that could reveal when they are helping or harming the cause of delivering accurate assessments of the world to the policy community
