because of the uneven distribution of fresh water in time and space and the increasing human population a large number of regions are experiencing water scarcity and stress membrane based desalination technologies like reverse osmosis have the potential to solve the fresh water crisis in coastal areas however in many cases membrane performance is restricted by biofouling biofouling of membrane systems gives a comprehensive overview on the state of the art strategies to control biofouling in spiral wound reverse osmosis membrane systems and point to possible future research directions despite the fact that much research and development has been done to overcome biofouling in spiral wound membrane systems used for water treatment biofouling is still a major practical problem causing performance decline and increased energy demand biofouling of membrane systems is divided into three sections including modelling and numerical analysis non destructive characterization and feed spacer geometry optimization it focuses on the development of biomass in the feed channel of the membrane module and its effect on pressure drop and hydrodynamics this book can be used to develop an integral strategy to control biofouling in spiral wound membrane systems an overview of several potential complementary approaches to solve biofouling is given and an integrated approach for biofouling control and feed spacer design is proposed

the anaerobic process is considered to be a sustainable technology for organic waste treatment mainly due to its lower energy consumption and production of residual solids coupled with the prospect of energy recovery from the biogas generated however the anaerobic process cannot be seen as providing the complete solution as its treated effluents would typically not meet the desired discharge limits in terms of residual carbon nutrients and pathogens this has given impetus to subsequent post treatment in order to meet the environmental legislations and protect the receiving water bodies and environment this book discusses anaerobic treatment from the perspective of organic wastes and wastewaters municipal and industrial followed by various post treatment options for anaerobic effluent polishing and resource recovery coverage will also be from the perspective of future trends and thoughts on anaerobic technologies being able to support meeting the increasingly stringent disposal standards the resource recovery angle is particularly interesting as this can arguably help achieve the circular economy it is intended the information can be used to

identify appropriate solutions for anaerobic effluent treatment and possible alternative approaches to the commonly applied post treatment techniques the succeeding discussion is intended to lead on to identification of opportunities for further research and development this book can be used as a standard reference book and textbook in universities for master and doctoral students the academic community relevant to the subject namely faculty researchers scientists and practicing engineers will find the book both informative and as a useful source of successful case studies
