a seminal work in health economics first published in 1972 michael grossman's *the demand for health* introduced a new theoretical model for determining the health status of the population his work uniquely synthesized economic and public health knowledge and has catalyzed a vastly influential body of health economics literature it is well past time to bring this important work back into print grossman bases his approach on gary s becker's household production function model and his theory of investment in human capital consumers demand health which can include illness free days in a given year or life expectancy and then produce it through the input of medical care services diet other market goods and services and time grossman also treats health and knowledge as equal parts of the durable stock of human capital consumers therefore have an incentive to invest in health to increase their earnings in the future from here grossman examines complementarities between health capital and other forms of human capital the most important of which is knowledge capital earned through schooling and its effect on the efficiency of production he concludes that the rate of return on investing in health by increasing education may exceed the rate of return on investing in health through greater medical care higher income may not lead to better health outcomes as wealth enables the consumption of goods and services with adverse health effects these are some of the major revelations of grossman's model findings that have great relevance as we struggle to understand the links between poverty education structural disadvantages and health

the link between health insurance and the workplace in the u s has led to concern over the possibility of insurance induced reductions in job mobility or job lock designing health insurance reforms which retain employer based insurance coverage but mitigate the extent of job lock requires an understanding of the policy dimensions to which job lock is most receptive we study a policy of limited insurance portability which has been adopted by a number of states and the federal government over the last 20 years these continuation of coverage mandates grant individuals the right to continue purchasing health insurance through their former employers for some period of time after leaving their jobs we find that the passage of these mandates caused a significant increase in the job mobility of prime age male workers this suggests that a sizeable share of job lock arises from short run concerns over portability rather than from long run problems

this paper examines whether middle age american households purchase adequate amounts of life insurance the analysis is based on sri international's 1980 1982 and 1984 surveys of the financial positions of american households our findings indicate that a significant minority of american wives are highly under insured with respect to the possible deaths of their husbands under the assumption that actuarially fair annuities are available we find that just over 30 percent of wives are inadequately insured by which we mean they would suffer a loss in their rate of sustainable consumption of at least 30 percent in the event of being widowed if one assumes that annuities are not available the fraction of wives who are inadequately insured is 24 percent these findings on inadequate life insurance are even more striking if one focuses on those households in which over half of the couple's present expected value of resources is dependent on the husband's survival the fraction of wives in such households who are inadequately insured is 41 percent if one assumes fair annuities are available and 31 percent if one assumes annuities are unavailable the problem of inadequate insurance is even more significant among households of more modest means almost half of wives in such households who are in need of life insurance protection are inadequately insured and this statement holds regardless of whether fair annuities are available the results of this paper together with those of the related literature strongly suggest that raising the share of social security benefits that are paid to surviving spouses as well as increasing in employer provided group life insurance could have a very considerable impact on the alleviation of poverty among widows especially elderly widows
