used mobile applications we consider two different perspectives in the search of energy efficient solutions from the application perspective we show that systematically quantifying the energy consumption of design choices e g communication patterns protocols and data formats contributes to a significantly smaller energy footprint from the system perspective we devise a cross layer solution that schedules packet transmissions based on the knowledge of the network parameters that impact the energy consumption of the handset these attempts show that application level decisions require a better understanding of possible energy apportionment policies at system level finally we study the generic problem of determining the contribution of an entity e g application to the total energy consumption of a given system e g mobile device we compare the state of the art policies in terms of fairness leveraging cooperative game theory and analyse their required information and computational complexity we show that providing incentives to reduce the total energy consumption of the system as part of fairness is tightly coupled to the policy selection our study provides guidelines to select an appropriate policy depending on the characteristics of the system
