this authoritative book shows how the gap between a group's mean iq and achievement can be precisely measured and then partitioned between two factors an important methodology with potential application for all ethnic groups in this case the author shows that chinese americans occupational achievements are generally far beyond their iq as if they had a mean iq 21 points higher than they actually do this unique approach to explaining group achievement emphasizes non iq factors such as historical origins family work ethic educational tradition personality traits and social institutions

this book's purpose is to enable educational researchers to make better use of the huge

longitudinal and cross sectional data files that are now readily available of value to experienced researchers and undergraduates alike the book focuses primarily on the planning and design of research rather than implementation of data base information its chapters address a variety of vital questions including what variables are present in each of the major national data bases what are the problems and dangers in making comparisons across data bases what factors invalidate comparisons of test scores across data bases in what ways can data from certain data bases be physically merged with data from other data bases this text clearly demonstrates what can be done with large national data bases and perhaps equally important what cannot be done or done only if certain precautions are taken

in this paper we analyze estimation of coefficients in regression models under moment restrictions where the moment restrictions are derived from auxiliary data our approach is similar to those that have been used in statistics for analyzing contingency tables with known marginals these methods are useful in cases where data from a small potentially non representative data set can be supplemented with auxiliary information from another data set which may be larger and or more representative of the target population the moment restrictions yield weights for each observation that can subsequently be used in weighted regression analysis we discuss the interpretation of these weights both under the assumption that the target population and the sampled population are the same as well as under the assumption that these populations differ we present an application based on omitted ability bias in estimation of wage regressions the national longitudinal survey young men s cohort nls as well as containing information for each observation on earnings education and experience records data on two test scores that may be considered proxies for ability the nls is a small data set however with a high attrition rate we investigate how to mitigate these problems in the nls by forming moments from the joint distribution of education experience and earnings in the 1 sample of the 1980 u s census and using these moments to construct weights for weighted regression analysis of the nls we analyze the impacts of our weighted regression techniques on the estimated coefficients and standard errors on returns to education and experience in the nls controlling for ability with and without assuming that the nls and the census samples are random samples from the same population
