it has been recognized for almost 200 years that certain families seem to inherit cancer it is only in the past decade however that molecular genetics and epidemiology have combined to define the role of inheritance in cancer more clearly and to identify some of the genes involved the causative genes can be tracked through cancer prone families via genetic linkage and positional cloning several of the genes discovered have subsequently been proved to play critical roles in normal growth and development there are also implications for the families themselves in terms of genetic testing with its attendant dilemmas if it is not clear that useful action will result the chapters in the genetics of cancer illustrate what has already been achieved and take a critical look at the future directions of this research and its potential clinical applications

patients with cancer can suffer from a bewildering variety of neurologic signs and symptoms the neurologic symptoms are often more disabling than the primary cancer symptoms including confusion seizures pain and paralysis may be a result of either metastases to the nervous system or one of several nonmetastatic complications of cancer the physician who promptly recognizes neurologic symptoms occurring in a patient with cancer and makes an early diagnosis may prevent the symptoms from becoming permanently disabling or sometimes lethal this monograph an update of the first edition published in 1995 is divided into 3 sections the first classifies the wide variety of disorders that can cause neurologic symptoms the patient with cancer discusses the pathophysiology of nervous system metastases the pathophysiology and treatment of brain edema and the approach to supportive care of common neurologic symptoms such as seizures pain and side effects of commonly used supportive care agents the second section is devoted to nervous system metastases addressing in turn brain spinal cord meningeal and cranial and peripheral nerve metastases describing clinical symptoms approach to diagnosis and current treatment the third section addresses several nonmetastatic complications of cancer and includes sections on vascular disease infections metabolic and nutritional disorders side chemotherapy radiation and other diagnostic and therapeutic procedures the final chapter addresses paraneoplastic syndromes the book is intended for practicing oncologists neurologists neurosurgeons and radiation oncologists as well as internists who treated patients with cancer our attempt was to write a book that would assist oncologists in understanding neurologic problems and neurologists in understanding oncologic problems the book is also intended for

physicians training to specialize in any of the above areas it includes a practical approach to the diagnosis and management of patients with neurologic disease who are with known to have cancer or in whom cancer is suspected

reports the results of an analysis of combined mortality data on 95 673 nuclear industry workers at seven facilities in the usa uk and canada workers at these facilities which include both atomic energy stations and nuclear weapons plants have been monitored in previous studies to determine the health effects of external exposure to ionizing radiation by combining and assessing data from previous studies the present analysis aimed to develop more precise estimates of the risk of radiation induced cancer and thus to strengthen the scientific basis for setting radiation protection standards the study also compared risk estimates among workers with estimates obtained in high dose studies including investigations of atomic bomb survivors and of patients irradiated for therapeutic purposes the results represent the most comprehensive and precise direct assessment to date of the carcinogenic risk of protracted external exposure to generally low doses of ionizing radiation the combined analysis of data on nuclear industry workers found a significant increase in the risk of leukemia and of myeloid leukemia in particular at relatively low dose levels the study also provided an opportunity to examine some of the previously reported associations between low doses of ionizing radiation and mortality from specific cancer types of the 36 cancer types or groupings considered most showed little or no association with radiation exposure apart from leukemia multiple myeloma was the only cancer to exhibit a statistically significant association with radiation dose

containing a retrospective view of every discovery and practical improvement in the medical sciences abstracted from the current medical journals of the united states and canada
