presents an outline of alexander grothendieck's theories this book discusses four main themes descent theory hilbert and quot schemes the formal existence theorem and the picard scheme it is suitable for those working in algebraic geometry

this is the first volume of a graduate level textbook series in the area of algebraic quantum symmetry the focus of this book series is on how one can do abstract algebra in the setting of monoidal categories it is intended for readers who are familiar with abstract vector spaces groups rings and ideals and the author takes care in introducing categorical concepts from scratch this book series on symmetries of algebras is intended to serve as learning books to newcomers to the area of research and a carefully curated list of additional textbooks and articles are featured at the end of each chapter for further exploration there are also numerous exercises throughout the series with close to 200 exercises in volume 1 alone if you enjoy algebra and are curious about how it fits into a broader context this is for you

algebraic numbers can approximate and classify any real number here the author gathers together results about such approximations and classifications written for a broad audience the book is accessible and self contained with complete and detailed proofs starting from continued fractions and khintchine's theorem bugeaud introduces a variety of techniques ranging from explicit constructions to metric number theory including the theory of hausdorff dimension so armed the reader is led to such celebrated advanced results as the proof of mahler's conjecture on s numbers the jarnik besicovitch theorem and the existence of t numbers brief consideration is given both to the p -adic and the formal power series cases thus the book can be used for graduate courses on diophantine approximation some 40 exercises are supplied or as an introduction for non experts specialists will appreciate the collection of over 50 open problems and the rich and comprehensive list of more than 600 references

this book is based on courses given at columbia university on vector bundles 1988 and on the theory of algebraic surfaces 1992 as well as lectures in the park city mathematics institute on 4 manifolds and donaldson invariants the goal of these lectures was to acquaint researchers in 4 manifold topology with the classification of algebraic surfaces and with methods for describing moduli spaces of holomorphic bundles on algebraic surfaces with a view toward computing donaldson invariants since that time the focus of 4 manifold topology has shifted dramatically at first because topological methods have largely superseded algebro geometric meth

ods in computing donaldson invariants and more importantly because of and witten which have greatly sim the new invariants defined by seiberg plified the theory and led to proofs of the basic conjectures concerning the 4 manifold topology of algebraic surfaces however the study of algebraic surfaces and the moduli spaces of bundles on them remains a fundamental problem in algebraic geometry and i hope that this book will make this subject more accessible moreover the recent applications of seiberg witten theory to symplectic 4 manifolds suggest that there is room for yet another treatment of the classification of algebraic surfaces in particular despite the number of excellent books concerning algebraic surfaces i hope that the half of this book devoted to them will serve as an introduction to the subject

a fully revised edition with brand new content and four practice tests includes four full practice tests with details answers and explanations fully revised with brand new content unlike typical revised editions of test prep titles features subject review materials for every discipline and an extensive math review
