cells have evolved multiple strategies to adapt the composition and quality of their protein  
 equipment to needs imposed by changes in intra and extracellular conditions the appearance of  
 proteins transmitting novel functional properties to cells can be controlled at a transcrip  
 tional posttranscriptional translational or posttranslational level extensive research over the  
 past 15 years has shown that transcriptional regulation is used as the predominant strategy to  
 control the production of new proteins in response to extracellular stimuli at the level of  
 gene transcription the initiation of mRNA synthesis is used most frequently to govern gene  
 expression the key elements controlling transcription initiation in eukaryotes are activator  
 proteins transactivators that bind in a sequence specific manner to short DNA sequences in the  
 of genes the activator binding sites are elements of larger proximity control units called  
 promoters and enhancers which bind many distinct proteins these may synergize or negatively  
 cooperate with the activators the *de novo* binding of an activator to DNA or if already bound to  
 DNA its functional activation is what ultimately turns on a high level expression of genes the  
 activity of transactivators is controlled by signalling pathways and in some cases

transactivators actively participate in signal transduction by moving from the cytoplasm into the nucleus in this first volume of inducible gene expression leading scientists in the field review six eukaryotic transactivators that allow cells to respond to various extracellular stimuli by the expression of new proteins
