physicists when modelling physical systems with a large number of degrees of freedom and statisticians when performing data analysis have developed their own concepts and methods for making the best inference but are these methods equivalent or not what is the state of the art in making inferences the physicists want answers more neural computation demands a clearer understanding of how neural systems make inferences the theory of chaotic nonlinear systems as applied to time series analysis could profit from the experience already booked by the statisticians and finally there is a long standing conjecture that some of the puzzles of quantum mechanics are due to our incomplete understanding of how we make inferences matter enough to stimulate the writing of such a book as the present one but other considerations also arise such as the maximum entropy method and bayesian inference information theory and the minimum description length finally it is pointed out that an understanding of human inference may require input from psychologists this lively debate which is of acute current interest is well summarized in the present work

one central and enduring image of the social science researcher is of an individual who commits a great deal of time to collecting original primary data from a field of enquiry this

approach is often underpinned by a sincerely held belief that key research questions can only be explored by the collection of ever new and ever greater amounts of data or that already existing data are insufficient for researchers to test their ideas yet such an approach to social science research can be problematic not least because the collection of primary data can be an expensive time consuming and even wasteful approach to social enquiry secondary analysis can serve many purposes as well as being a valid approach in its own right however despite its widespread application secondary analysis is often undervalued or perceived to be the preserve of only those interested in the re use of large scale survey data highlighting both the theory and practice of secondary analysis and the use of secondary sources this collection considers the nature of secondary analysis as a research tool reflects on the definitional debates surrounding terms such as secondary analysis data re use and restudies illustrates how secondary analysis is used in social science research and finally reviews the practical methodological and ethical aspects of secondary analysis volume one using secondary sources and secondary analysis volume two quantitative approaches to secondary analysis volume three qualitative data and research in secondary analysis volume four ethical methodological and practical issues in secondary analysis
