for all kinds of materials phase transformations show common phenomena and mechanisms and often turn a material for example metals multiphase alloys ceramics or composites into its technological useful form the physics and thermodynamics of a transformation from the solid to liquid state or from one crystal form to another are therefore essential for creating high performance materials this handbook covers phase transformations a general phenomenon central to understanding the behavior of materials and for creating high performance materials it will be an essential reference for all materials scientists physicists and engineers involved in the research and development of new high performance materials it is the revised and enhanced edition of the renowned book edited by the late p haasen in 1990 vol 5 materials science and technology

the present book covers the transport properties of superconductor two dimensional electron gas josephson junctions starting with the basic el ement a superconductor two dimensional electron gas interface phase co herent andreev reflection in hybrid josephson junctions is introduced and

further on multiterminal structures are discussed special care is taken on explaining the underlying theoretical concepts related to the transport mechanisms employing a two dimensional electron gas in a semiconductor as a normal conductor opens up the possibility to observe effects not found in purely metallic junctions one example is the light sensitivity of the semiconductor which has a direct impact on the supercurrent in the Josephson junction many of the effects reported here rely on the fast technological progress in the epitaxial growth of III-V semiconductor heterostructures by using these layer systems fascinating quantum effects have been found two examples out of many are the quantized conductance in a point contact and electron optics using ballistic electron beams by combining heterostructures with superconductors many of the effects found in purely semiconductor systems can in a sense be transferred to the superconducting state a prominent example is the quantization of the critical current in a superconducting quantum point contact
