in practice central banks have been confronted with a trade off between stabilising inflation and output when

dealing with rising oil prices this contrasts with the result in the standard new keynesian model that ensuring complete price stability is the optimal thing to do even when an oil shock leads to large output drops to reconcile this apparent contradiction this paper investigates how monetary policy should react to oil shocks in a microfounded model with staggered price setting and with oil as an input in a CES production function in particular we extend Benigno and Woodford 2005 to obtain a second order approximation to the expected utility of the representative household when the steady state is distorted and the economy is hit by oil price shocks the main result is that oil price shocks generate an endogenous trade off between inflation and output stabilisation when oil has low substitutability in production therefore it becomes optimal for the monetary authority to stabilise partially the effects of oil shocks on inflation and some inflation is desirable we also find in contrast to Benigno and Woodford 2005 that this trade off is reduced but not eliminated when we get rid of the effects of monopolistic distortions in the steady state moreover the size of the endogenous cost push shock generated by fluctuations in the oil price increases when oil is more difficult to substitute by other factors
