an introduction to complex analysis in several variables

the aim of this book is to lead the reader out from the ordinary routine of computing and calculating by engaging in a more dynamic process of learning this learning by doing approach can be traced back to aristotle who wrote in his nicomachean ethics that for the things we have to learn before we can do them we learn by doing them the theory is illustrated through many relevant examples followed by a large number of exercises whose requirements are rendered by action verbs find show verify check and construct readers are compelled to analyze and organize analytical skills rather than placing the exercises in bulk at the end of each chapter sets of practice questions after each theoretical concept are included the reader has the possibility to check their understanding work on the new topics and gain confidence during the learning activity as the theory unfolds the exercises become more complex sometimes they span over several topics hints have been added in order to guide the reader in the process this book stems from the differential calculus course which the author taught for many years the goal of this book is to immerse the reader in the subtleties of differential calculus through an active perspective particular attention was paid to continuity and differentiability topics presented in a new course of action

advanced calculus of several variables provides a conceptual treatment of multivariable calculus this book emphasizes the interplay of geometry analysis through linear algebra and approximation of nonlinear mappings by linear ones the classical applications and computational methods that are responsible for much of the interest and importance of calculus are also considered this text is organized into six chapters chapter i deals with linear algebra and geometry of euclidean n space rn the multivariable differential calculus is treated in chapters ii and iii while multivariable integral calculus is covered in chapters iv and v the last chapter is devoted to venerable problems of the calculus of variations this publication is intended for students who have completed a standard introductory calculus sequence

mathematics for physical chemistry third edition is the ideal text for students and physical chemists who want to sharpen their mathematics skills it can help prepare the reader for an undergraduate course serve as a supplementary text for use during a course or serve as a reference for graduate students and practicing chemists the text concentrates on applications instead of theory and although the emphasis is on

physical chemistry it can also be useful in general chemistry courses the third edition includes new exercises in each chapter that provide practice in a technique immediately after discussion or example and encourage self study the first ten chapters are constructed around a sequence of mathematical topics with a gradual progression into more advanced material the final chapter discusses mathematical topics needed in the analysis of experimental data numerous examples and problems interspersed throughout the presentations each extensive chapter contains a preview objectives and summary includes topics not found in similar books such as a review of general algebra and an introduction to group theory provides chemistry specific instruction without the distraction of abstract concepts or theoretical issues in pure mathematics
