stochastic finance and financial engineering have been rapidly expanding fields of science over the past four decades mainly due to the success of sophisticated quantitative methodologies in helping professionals manage financial risks in recent years we have witnessed a tremendous acceleration in research efforts aimed at better comprehending modeling and hedging this kind of risk these two volumes aim to provide a foundation course on applied stochastic finance they are designed for three groups of readers firstly students of various backgrounds seeking a core knowledge on the subject of stochastic finance secondly financial analysts and practitioners in the investment banking and insurance industries and finally other professionals who are

interested in learning advanced mathematical and stochastic methods which are basic knowledge in many areas through finance volume 1 starts with the introduction of the basic financial instruments and the fundamental principles of financial modeling and arbitrage valuation of derivatives next we use the discrete time binomial model to introduce all relevant concepts the mathematical simplicity of the binomial model also provides us with the opportunity to introduce and discuss in depth concepts such as conditional expectations and martingales in discrete time however we do not expand beyond the needs of the stochastic finance framework numerous examples each highlighted and isolated from the text for easy reference and identification are included the book concludes with the use of the binomial model to introduce interest rate models and the use of the markov chain model to introduce credit risk this volume is designed in such a way that among other uses makes it useful as an undergraduate course

contains research articles on the mathematics and applications of control theory and on those parts of optimization theory concerned with the dynamics of deterministic or stochastic systems in continuous or discrete time or otherwise dealing with differential equations dynamics infinite dimensional spaces or fundamental issues in variational analysis and geometry

includes annual list of doctoral dissertations in political economy in progress in american universities and colleges and the hand book of the american economic association

for a first course in materials sciences and engineering taught in the departments of materials science mechanical civil and general engineering this text provides balanced current treatment of the full spectrum of engineering materials covering all the physical properties applications and relevant properties associated with engineering materials it explores all of major categories of materials while also offering detailed examinations of a wide range of new materials with high tech applications publisher s website
