traditional trade theory explains trade only by differences between countries notably differences in their relative endowments of factors of production it suggests an inverse relationship between the similarity of countries and the volume of trade between them the heckscher ohlin ho factor proportions theory derives the determinants of comparative advantage in a world of two goods two factors two countries it predicts that each country will export that good which uses the country's abundant factor relatively most intensively the literature on trade offers an impressive number of studies based on the ho theory the main methodological problems encountered in the literature are first the appropriate formulation of the ho theorem in a multi factor multi good and multi country framework second proper tests of the ho theory and proper links of the theory to empirical analysis the relevance of the ho theory began to be questioned when important facts of modern international trade proved to be inconsistent with its theoretical framework leontief 1953 tested the factor proportions theory using the us

data for 1947 and found that the us had more labor intensive exports than imports which is opposed to both perceptions and estimations of factor endowments the leontief paradox created doubt as to whether or not actual trade patterns and factor endowments are related as predicted by theory and caused many controversial discussions with regard to the proper empirical implementation of the factor proportions theory
